

JEGSTER OUTRIGGER KIT 940018

Frame outriggers are an alternate roll bar or cage mounting method. The floor plates included with Jegster bars and cages are not used when outriggers are. The illustration below shows a typical installation. Note that the floor is notched to allow the outrigger to partially pass through. Sometimes the outrigger may be angled upward at the outer end more than shown, sometimes less. The outrigger is trimmed to mate to the sub frame and to the inside wall of the rocker panel. Then weld solid to the sub frame, the rocker panel, and the floor. The cage main hoop is then fit and welded on top of the outrigger tube. The installation at the front of the cage for the front post and the side bar is similar in appearance. See Jegster roll bar or cage instructions.
