

INSTALLATION INSTRUCTIONS FOR #9710

WARNING! NOT FOR VEHICLES EQUIPPED WITH FUEL INJECTION SYSTEMS

This adjustable fuel pressure regulator is designed for use on fuel systems equipped with a carburetor using 5/16" or 3/8" ID fuel lines, not exceeding 8 lbs of fuel pressure. Mr. Gasket #2842G Teflon tape is recommended to be used on all threaded fittings to insure a positive thread seal and prevent fuel leaks.

Tighten brass fuel fittings so threads are fully engaged into fuel regulator. Do not over-tighten fittings or fuel leaks may result. After installing fuel regulator, start engine and check fuel lines for possible leaks, fuel leaks may cause a fire hazard and potentially explosive. Fuel pressure adjustment is from 1 to 6 lbs.
