

INSTALLATION INSTRUCTIONS COOLANT EXPANSION TANK

OEM LOCATION, LOTUS 2ZZ-GE

Document: 19-0132 **Support**: info@radiumauto.com

WARNINGS:

DO NOT WORK ON THE COOLANT SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE. WAIT UNTIL THE ENGINE HAS COOLED AND THERE IS NO LONGER PRESSURE IN THE SYSTEM.

QUICKLY CLEAN UP ANY COOLANT THAT HAS SPILLED AS IT IS POISONOUS.

STEP	TOOLS NEEDED	INSTRUCTIONS	РНОТО
1	Metric Allen wrench Torque wrench Anti-seize	Unwrap the halves of the coolant tank and clean out any residual packaging material. Place the included gasket in between the 2 coolant tank halves. Using a 3mm Allen hex wrench, install the 7 included socket head bolts. It is recommended to use anti-seize on the threads to prevent galling. Tighten all bolts evenly until snug in a crisscross sequence (as shown), then tighten each bolt to 38 in-lbs. using a calibrated torque wrench. Do not overtighten! NOTE: After the tank is heat cycled, check the gasket for leaks and retorque if needed.	4 2 5
2		Hand-tighten both elbow fittings in the 1/8" NPT ports. Then add an additional 1.5 to 3 turns until tight. The tapered pipe threads are preimpregnated with Teflon so no addition lubrication is required. In order to install the clear tubing, temporarily clock each fitting, as shown. Verify that the included clear tubing is 81mm (+/-1mm). Push-in and fully insert the tubing into either elbow fitting, as shown.	PUSH-IN UNTIL FULLY SEATED
3		Bend the tube just enough to get it into the opposing instant tube fitting, as shown. NOTE: the fittings might need to be rotated slightly.	
4	8mm open end wrench	Using an 8mm open end wrench, rotate the elbow fittings so they are in line with one another. NOTE: if not tight enough, the elbow fittings may need to be rotated 360 degrees.	

5		Inspect the tubing. If it is not get completely straight, the tube is most likely slightly too long, as shown. To fix, rotate the elbow fittings back as before. Simultaneously push the retaining locks flush to release the tube from the each elbow fitting. Shorten the tube slightly, then reinstall. Make sure the area shown in the picture is free of dirt and debris before	
6		proceeding. Place the included O-ring into the groove around the fill neck opening.	CHARLES CONTRACTOR
7	3mm Allen wrench Thread locker	Place the included fill neck receiver onto the tank, oriented to best fit the application. Apply a medium strength thread locker and install the 3 included socket head bolts using a 3mm Allen hex wrench, as shown. Torque to 48 in-lbs. (5.4Nm).	College College
8	Lubrication oil 3/4" wrench 1" wrench	Before installing the 3 included adapter fittings, lubricate the O-rings with light oil. Secure the two 10AN ORB to 6AN male fittings into the bottom ports and the 6AN ORB to 6AN male fitting to the side port. NOTE: The tank's internal chambers are divided vertically down the middle for the swirl mechanism, but small passages on the top and bottom allow water to flow throughout the complete tank.	
9	Pliers 10mm wrench	 Before uninstalling, note the functions of the colored hoses shown. Red (14): Hot water air-bleed coming out of the cylinder head. Green (11): Coolant returning from the tank to the thermostat housing. Blue (54): Radiator air-bleed and bypass when thermostat is closed. These hoses and the overflow tube (46) will be reused. Place a tray and shop towels under the factory coolant tank (15). Using pliers, slide the spring clamps (41, 42, & 44) down off the coolant tank barbs. One by one, gently pull off all 3 hoses. Unscrew the 2 upper M6 bolts (12 & 16). 	14 42 16 12 15 RED 18 42 16 12 15 44 42 44 42 BLUE GREEN 11 52 54
10	Cutting dikes 10mm wrench 13mm wrench	Remove the tank from the vehicle. Next, the steel bracket assembly (17) will be discarded. Cut the zip ties that are holding the 2 coolant lines in place. Unplug the electric hot soak water pump. Unscrew the M6 bolt (42) , shown at right, that clamps the water pump (18) . Remove the factory M8 bolt (52) near the left side motor mount. This bolt will be reused. Carefully lift the steel bracket out without disrupting the water pump that is still attached and plumbed to the engine.	

	13mm wrench	Peel the water pump rubber sleeve off the OEM bracket.	
	17mm wrench	Locate the Radium water pump mount, clamp, M8 bolt, and M8 nut in the	
		kit. Loosely assemble the parts as shown. Rewrap the electric water pump	
11		with the OEM rubber sleeve and slide the assembly around the pump.	
11		Tighten the included bolts to the two empty M10x1.25 threaded bosses on	
		the transmission case (pictured). Tighten the M8 bolt/nut.	
		Reconnect the electric hot soak water pump.	
	Thread locker	The mounting bracket will be secured to the coolant tank using the 3 inner	
	4mm Allen wrench	slotted bolts holes. Apply a medium strength thread-locker to the three M6	
	10mm wrench	bolts. Secure the bracket to the coolant tank using a 4mm Allen hex wrench.	
	13mm wrench	Insert the supplied M6 washer bolt through the upper rubber grommet.	
12	15mm Wrenem	Using a 10mm wrench, secure the M6 washer bolt to the hidden roll bar	
		mount. Find the included 1-3/4" OD clamp and wrap it around the 2 hoses that were secured by the zip ties previously cut. Slide the factory M8 bolt	
		through the clamp and rubber grommet and secure to the motor mount	
		boss.	
		Gently bend the clamp into an oval D shape so it does not disrupt flow	
		through the 2 large hoses.	GREEN
		Push the factory overflow tube onto the Radium neck barbed fitting. It is a bit too big for the barb so use the opposite end. Note: if the engine	RED
13		overheats, coolant will flow out of this port. A long hose (not included) can	
		be attached instead and routed down to the rear of the car.	V TO TO

15	11/16" wrench Pliers	 hose ends to the factory hoses, note how the lines will be routed (pictured). It is necessary to cut the factory "blue" hose shorter to help eliminate a potential air lock. Make sure all 3 hoses flow downwards away from the tank to allow proper air bleeding. Also, be sure to leave enough slack for engine movement. To assemble all 3 included 90 degree hose ends to the factory hoses, simply push the barbed end into each hose, straight hose end shown as example. Make sure the hose is all the way against the hose end nut. Reuse the factory spring clamps to secure the connection, as shown. Using a non-marring 11/16" open end wrench, carefully tighten the "green" and "blue" hose ends to the Radium Coolant Tank port fittings. Note: The "red" hose end will be tightened after the tank is filled with coolant to aid in air bleeding. Lotus recommends a 50/50 mix of Havoline XLC Extended Life Coolant. When filling the coolant tank, unscrew the rear air bleed plug (pictured). Note: If filling the entire system, there is also an air bleed plug near the radiator and is accessed under the front right removable panel. Opening these bleed screws alleviates a potential air lock. 	

17	11/16" wrench	Once the tank sight tube registers half full, screw the "red" hose end back into the tank. Note: The level will naturally rise as the engine warms up from heat expansion. Start the engine and monitor the digital coolant display on the dash. Note: There will be no coolant reading until the engine heats up. If the temperature continues to climb towards 212F (100C), there is a trapped air bubble(s). This is common in the 2ZZ-GE. An effective remedy is using a coolant re-filler, such as OTC P/N: 75260 (pictured).	
		coolant re-filler, such as OTC P/N: 75260 (pictured).
