## Part # 11323510 78-88 GM "G" Body Single Adjustable Front CoilOvers For Use w/ StrongArms

## Shock Assembly:

- 2 24139999 3.6" stroke single adjustable shock
- 2 70008649 2" adjustable threaded stud top
- 2 90001994 .625" I.D. bearing
- 4 90001995 Bearing snap ring

## **Components:**

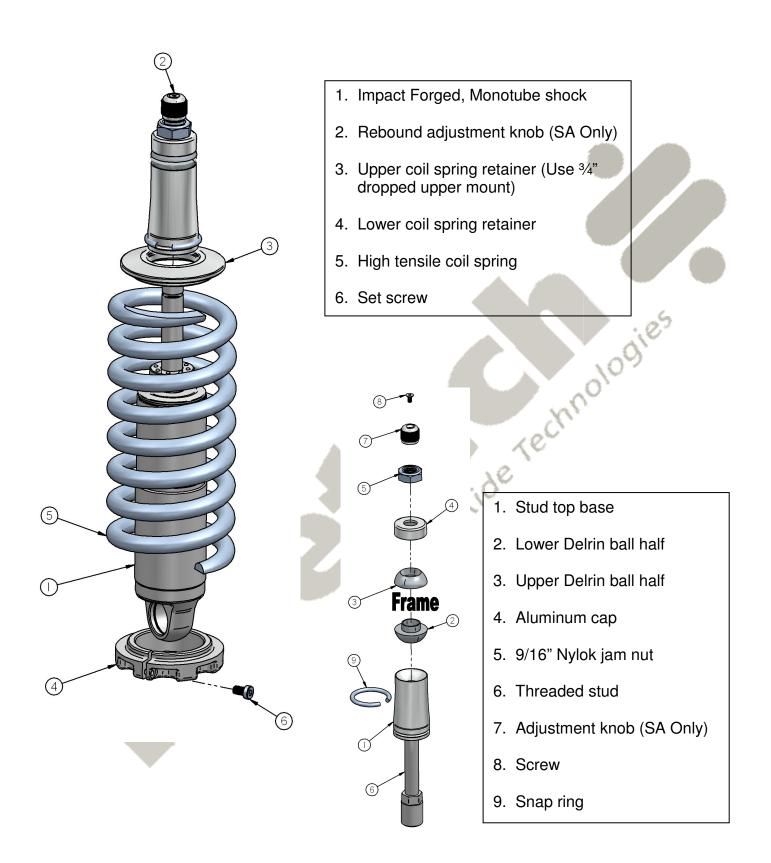

- 2 59080900
- 2 90002312
- stud top base Spring retainer kit (Do not use standard upper mount) 3/4" Dropped upper mount Aluminum cap for Delrin ball Delrin ball upper bert 2 90002222 AirRide
- 2 90002070
- 2 90001902
- 2 90001903
- 2 90001904 Delrin ball lower half

## Hardware:

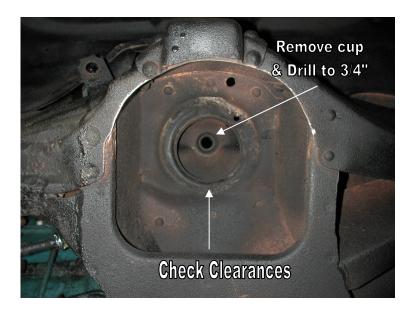

9/16" SAE Nylok jam nut 2 99562003

Stud top hardware

# coilover

# coilover

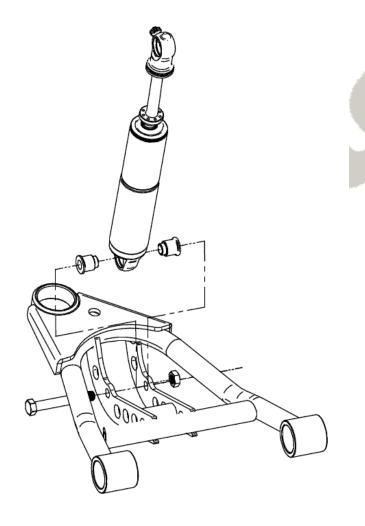

1. To allow the step in the lower Delrin ball half to slide into the factory shock hole, the bushing cup (if your car has one) will need to be removed and the hole may need to be drilled out to  $\frac{3}{4}$ ".

2. Assemble the CoilOver then place into the coil spring pocket w/ the stud and lower Delrin ball sticking through the factory shock hole.

3. Check clearance between the upper factory spring retaining lip and stud top base. Allowing this to hit could cause the shock to break, this

4. Place the upper Delrin ball over stud, then the aluminum cap. Secure the assembly w/ the 9/16" Nylok jam nut.

5. Attach the bottom of the shock to the lower StrongArms using the spacers and hardware supplied w/ the arm.

### **Ride Height**

We have designed most cars to have a ride height of about 2" lower than factory. To achieve the best ride quality & handling, the shock absorber needs to be at 40-60% overall travel when the car is at ride height. This will ensure that the shock will not bottom out or top out over even the largest bumps. Measuring the shock can be difficult, especially on some front suspensions. Measuring overall wheel travel is just as effective and can be much easier. Most cars will have 4-6" of overall wheel travel. One easy way to determine where you are at in wheel travel is to take a measurement from the fender lip (center of the wheel) to the ground. Then lift the car by the frame until the wheel is just touching the ground, re-measure. This will indicate how far you are from full extension of the shock. A minimum of 1.5" of extension travel (at the wheel) is needed to ensure that the shock does not top out. If you are more than 3" from full extension of the shock then you are in danger of bottoming out the shock absorber.

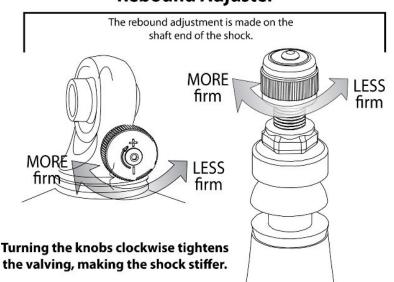

## **Adjusting Spring Height**

When assembling the CoilOver, screw the spring retainer tight up to the spring (0 preload). After entire weight of car is on the wheels, jounce the suspension and roll the car forward and backward to alleviate suspension bind.

- If the car is too high w/ 0 preload then a smaller rate spring is required. Although threading the spring retainer down would lower the car, this could allow the spring to fall out of its seat when lifting the car by the frame.
- If the car is too low w/ 0 preload, then preload can then be added by threading the spring retainer up to achieve ride height. On 2.6" 4" stroke shocks, up to 1.5" of preload is acceptable. On 5-7" stroke shocks, up to 2.5" of preload is acceptable. If more preload is needed to achieve ride height a stiffer spring rate is required. Too much preload may lead to coil bind, causing ride quality to suffer.

## Shock Adjustment Instructions

**Rebound Adjuster** 

Rebound is the force required to open or "expand" the shock absorber back to its original position.

. 0.

Adjusters knobs on a ring mount have 30 clicks of adjustment. On a stud top mount there are 20 clicks of adjustment.

Because of the fine adjustment range RideTech recommends adjusting 3-4 clicks minimum when making a shock valve change.

All RideTech Shocks are shipped from the factory at the FULL SOFT position.
