*Forged Torsion Bars*  
*Installation Instructions*

Thank you for your purchase of this Hotchkis Performance product. Your torsion bar set was designed with the performance and durability you've come to expect from Hotchkis Performance.

*Note: Please read the entire installation instructions before starting. Having the right tools will ensure a smooth install process.*

- 1. Remove Upper Control Arm Droop stop**  
Access underneath the front fender and unbolt the droop stop snubber that normally restricts how low the suspension can droop. Droop refers to the suspension completely decompressed (or hanging down in mid-air) as it would if the entire weight of the vehicle was off of the wheels.
- 2. Raise the Front of the Vehicle**  
Jack the front of the vehicle up and support the chassis with jack stands. Allow the front suspension to fully droop.
- 3. Loosen Torsion Bar Tension**  
Fully loosen the torsion bar tension bolt under the lower control arm on both sides.
- 4. Remove the Torsion Bar Retainer Clip**  
Move toward to the rear end of the torsion bar and remove the retaining clip located in the cross member.
- 5. Mark Current Torsion Bars**  
For future reference, mark each torsion bar that is on the car left or right. It is important to always put used torsion bar back on the original side.
- 6. Remove Torsion Bars**  
Use a torsion bar removal tool (Miller Tools C-3728 or similar) to grip onto the torsion bar and tap it out toward the rear of the car. Note: There are different removal tools available and some customers have made their own. However, we highly suggest that you do not use vise grips on the torsion bars. This can damage the torsion bar by marring the surface causing a potential stress point.

**7. Hex End Clocking**

Since the Hotchkis torsion bars are larger (stiffer) than most stock bars, the hex ends may be clocked differently compared to the old bars you had. Please note that these are performance torsion bars suited for a car that is intended to be lower than stock.

**8. Install Hotchkis Torsion Bar**

Grease both ends of the torsion bar as well as the control arm cavity and cross member cavity. Insert the torsion bar in the same manner as removal, starting from the rear and working your way forward. Using a floor jack, raise the suspension on the side you are working on to line up/clock the control arm cavity with the hex on the torsion bar.

**9. Replace Retainer Clip**

Once the bar is completely positioned and seated, insert the retainer clip into the crossmember cavity.

**10. Set Adjuster Bolt for Initial Setting**

Tighten the adjuster bolt under each control arm to about  $\frac{1}{2}$  to  $\frac{3}{4}$  of it's travel. This should be a good starting off point.

**11. Lower the Vehicle**

Lower the vehicle back onto the ground and roll the car back and forth.

**12. Adjust Ride Height**

Adjust ride height to desired height. Keep in mind that these torsion bars are meant for lower-than-stock stances.

**13. Reinstall Upper Control Arm Droop Stop**

Access underneath the front fender again and reattach the droop stop snubber.

**14. Perform front wheel alignment**

It is highly recommended that you perform a front wheel alignment once you are finished. Excessive toe-in or toe-out as a result of the initial ride height change can cause the vehicle to raise or lower as you move forward or backward. We suggest  $\frac{1}{8}$ " of toe-in.
