

JEGSTER FOUR LINK KIT 40011

This four link kit is designed to be compatible with almost any drag race application. The frame brackets may be trimmed to fit many different frame configurations. When this kit is used with Jegster rear rails 40610, 40745, or 950022, the frame brackets will not require any trimming. Other related parts that are compatible with this four link are: 40018 track rod, 40024 wish bone, 40015 lower shock mount, 40017 upper shock mount, 40096 anti roll bar.

The housing bracket bolt centerline should be vertical when the car is finished and on a level surface. The pinion angle will depend on your engine mounting position. See Jegster motor plate instructions. Be sure to keep the geometry of the suspension the same as illustrated, the lower tube should be parallel to the track when connected to the center frame bracket hole as illustrated.

The housing brackets may be cut through the center of the housing hole, making a top half and a bottom half, if the housing ends are already installed. Then the bracket halves are placed on the housing, welded together, and to the housing. Take care to keep the bracket parts aligned and the top to bottom hole spacing unchanged, especially when they are trimmed to fit a larger housing.

Proceed carefully, make sure welding is properly done, make sure that the geometry is correct, Check the thread engagement when adjusting, etc.
