JEGSTER CHUTE CORD MOUNT # 40412

The height of the chute cord attaching bolt should be the same as the height of the center of gravity of the car. This will ensure that the chute deployment will not unload either the rear or the front tires. This height will be approximately 18 to 20 inches from the track on most modern drag race door slammers. Of course this height will be lower on a dragster and could be much higher on other cars.

An example of a typical installation is shown below. The main mount tube and the braces are fit and welded to a frame crossmember. The cord mount could also be welded to the rear end housing on a dragster. BE SURE THAT YOUR INSTALLATION IS STURDY ENOUGH TO ACCEPT THIS LOADING.
