Packing List: Evaporator Kit (564284)

No.	Qty.	Part No.	Description
1.	1	765200	Gen 5 Super Magnum Module with 404 ECU
2.	1	784284	Accessory Kit

**** Before beginning installation, open all packages and check contents of shipment.
Please report any shortages directly to Vintage Air within 15 days. After 15 days,
Vintage Air will not be responsible for missing or damaged items.**

Important Notice—Please Read

For Maximum System Performance, Vintage Air Recommends the Following:

NOTE: Vintage Air systems are designed to operate with R134a refrigerant only. Use of any other refrigerant could damage your A/C system and/or vehicle, and possibly cause a fire, in addition to potentially voiding the warranties of the A/C system and its components.

Refrigerant Capacities:

Vintage Air System: 1.8 lbs. (28.8 oz.) or 816 grams of **R134a**, charged by weight with a quality charging station or scale. **NOTE:** Use of the proper type and amount of refrigerant is critical to system operation and performance.

Other Systems: Consult manufacturer's guidelines.

Lubricant Capacities:

New Vintage Air-Supplied Sanden Compressor: No additional oil needed (Compressor is shipped with proper oil charge).

All Other Compressors: Consult manufacturer (Some compressors are shipped dry and will need oil added).

Safety Switches

Your Vintage Air system is equipped with a binary pressure safety switch. A binary switch disengages the compressor clutch in cases of extreme low pressure conditions (refrigerant loss) or excessively high head pressure (406 PSI) to prevent compressor damage or hose rupture. A trinary switch combines Hi/Lo pressure protection with an electric fan operation signal at 254 PSI, and should be substituted for use with electric fans. Compressor safety switches are extremely important since an A/C system relies on refrigerant to circulate lubricant.

Service Info:

Protect Your Investment: Prior to assembly, it is critical that the compressor, evaporator, A/C hoses and fittings, hardlines, condenser and receiver/drier remain capped. Removing caps prior to assembly will allow moisture, insects and debris into the components, possibly leading to reduced performance and/or premature failure of your A/C system. This is especially important with the receiver/drier.

Additionally, when caps are removed for assembly, **BE CAREFUL!** Some components are shipped under pressure with dry nitrogen.

Evacuate the System for 35-45 Minutes: Ensure that system components (Drier, compressor, evaporator and condenser) are at a temperature of at least 85°F. On a cool day, the components can be heated with a heat gun **or** by running the engine with the heater on before evacuating. Leak check and charge to specifications.

Bolts Passing Through Cowl and / or Firewall:

To ensure a watertight seal between the passenger compartment and the vehicle exterior, for all bolts passing through the cowl and/or firewall, Vintage Air recommends coating the threads with silicone prior to installation.

Heater Hose (not included with this kit):

Heater hose may be purchased from Vintage Air (Part#31800-VUD) or your local parts retailer. Routing and required length will vary based on installer preference.

Important Wiring Notice—Please Read

Some vehicles may have had some or all of their radio interference capacitors removed. There should be a capacitor found at each of the following locations:

- 1. On the positive terminal of the ignition coil.**
- 2. If there is a generator, on the armature terminal of the generator.**
- 3. If there is a generator, on the battery terminal of the voltage regulator.**

Most alternators have a capacitor installed internally to eliminate what is called “whining” as the engine is revved. If whining is heard in the radio, or just to be extra cautious, a radio interference capacitor can be added to the battery terminal of the alternator.

It is also important that the battery lead is in good shape and that the ground leads are not compromised. There should be a heavy ground from the battery to the engine block, and additional grounds to the body and chassis.

If these precautions are not observed, it is possible for voltage spikes to be present on the battery leads. These spikes come from ignition systems and charging systems, and from switching some of the vehicle’s other systems on and off. Modern computer-operated equipment can be sensitive to voltage spikes on the power leads, which can cause unexpected resets, strange behavior and/or permanent damage.

Vintage Air strives to harden our products against these types of electrical noise, but there is a point where a vehicle’s electrical system can be degraded so much that nothing can help.

Radio interference capacitors should be available at most auto and truck parts suppliers. They typically are cylindrical in shape, a little over an inch long and a little over a half-inch in diameter, and they have a single lead coming from one end of the cylinder with a terminal on the end of the wire, as well as a mounting clip which is screwed into a good ground on the vehicle. The specific value of the capacitance is not too significant in comparison to ignition capacitors that are matched with the coil to reduce pitting of the points.

- Care must be taken, when installing the compressor lead, not to short it to ground. The compressor lead must not be connected to a condenser fan or to any other auxiliary device. Shorting to ground or connecting to a condenser fan or any other auxiliary device may damage wiring or the compressor relay, and/or cause a malfunction.
- When installing ground leads on Gen 5 systems, the blower control ground and ECU ground must be connected directly to the negative battery post.
- For proper system operation, the heater control valve must be connected to the ECU.

www.vintageair.com

Engine Compartment Disassembly

NOTE: Before starting the installation, check the function of the vehicle (horn, lights, etc.) for proper operation, and study the instructions, illustrations, photos & diagrams.

Perform the Following:

1. Disconnect the battery.
2. Remove the battery and battery tray (retain).
3. Drain the radiator.
4. Evacuate the A/C system (if necessary).
5. Remove the OEM condenser and drier (discard) (See Figure 1, below).
6. Remove the OEM A/C lines from the compressor to the evaporator (discard) (See Figure 1, below).
7. Remove the OEM compressor and bracket (discard) (See Figure 1, below).
8. Remove the evaporator blower assembly (discard). **NOTE: To remove the evaporator and blower assembly (under hood) and the air distribution system (under dash), the factory manual recommends removing the passenger side inner fender.**
9. Remove the OEM heater hoses, A/C hoses and hardlines (discard) (See Figure 1, below).
10. Remove the A/C and heater wiring/vacuum harness molded grommet (See Figure 1, below).
11. Install a 1 3/4" plug in the firewall as shown in Figure 1, below.

NOTE: On 1968 models only, once the battery is removed, remove the A/C hoses and grommet from beside the battery tray (Retain the (4) OEM grommet mounting screws).

www.vintageair.com

Condenser Assembly and Installation

1. Refer to separate instructions included with the condenser kit to install the condenser.
2. Binary switch installation (Refer to condenser instructions).

Compressor and Brackets

1. Refer to separate instructions included with the bracket kit to install the compressor bracket.

Pulleys

1. In most instances, the belt lengths will remain the same.

Passenger Compartment Disassembly

NOTE: Removal of the dashboard is required to install the evaporator. Vintage Air recommends using the factory service manual when disassembling and reassembling the dashboard.

Perform the following:

1. Remove the dash pad by removing (6) OEM screws (retain) (See Figure 1, below).
2. Lower the steering column. Protect the steering column with a cloth.
3. Disconnect all wires and cables from the instrument panel, speedometer, control panel and radio.
4. Remove the instrument panel retaining screws at the top, bottom and side of panel.
5. Remove the glove box and glove box door (retain hardware and door).
6. Remove all hoses and ducting from the OEM louvers (See Figure 1, below).
7. Remove the (2) OEM under dash louver assemblies (discard) (See Figure 1, below).
8. Remove the OEM defrost duct assembly by removing the (4) screws (discard) (See Figure 2, below).
9. Remove the OEM A/C and heater assembly (discard) (See Figure 2, below).
10. Remove the passenger-side kick panel/fresh air door assembly as shown in Figure 1a, below.

Figure 1

Figure 1a

Figure 2

www.vintageair.com

Dash Support Brace Modification and Installation

NOTE: This modification is necessary to install the Super Magnum evaporator module.

1. Locate the new dash support brace in the accessory kit.
2. Using the dash support brace as a guide, enlarge the hole in the OEM dash support brace to accommodate the 1/4-20 x 3/4" hex bolt (if necessary).
3. Secure the dash support brace to the OEM support brace using a 1/4-20 x 3/4" hex bolt, 9/32" flat washer and a 1/4-20 hex nut with star washer (See Photo 1, below).
4. Using the new brace as a template, drill a lower mounting hole for the 1/4-20 x 3/4" hex bolt.
5. Secure the support brace using a 1/4-20 x 3/4" hex bolt, 9/32" flat washer and 1/4-20 hex nut with star washer (See Photo 2, below).
6. Remove the section of the OEM brace as shown in Photos 2 and 3, below.

Photo 1

Photo 2

Photo 3

www.vintageair.com

Firewall Modification

1. Remove the Christmas tree style insulation retainers and OEM insulation up to the transmission tunnel.
2. Flatten the edges of the firewall opening (See Photo 1, below).
3. Place the firewall cover onto the firewall. Locate the (8) mounting holes and enlarge the holes in the firewall to 9/32" to accommodate the 1/4-20 mounting bolts (See Figure 1, below). **NOTE: The upper hole will have to be drilled into the cowl area (See Figure 1, below).**

Photo 1

Figure 1

Firewall Cover Installation and Insulation

NOTE: For proper system operation, Vintage Air recommends using Dynaliner (461500-VIP) heat-blocking insulation in the area around the evaporator module (firewall, kick panel, inner cowl, firewall covers). Due to tight clearance for the evaporator module between the firewall and dash, Vintage Air recommends an insulation thickness of no more than 1/8".

1. Install (5) 1/4-20 x 3/4" serrated flange bolts and a 1/4-20 x 1" serrated flange bolt with 1/4" pushnut bolt retainers onto the firewall cover (See Photo 1, below).
2. Apply silicone to the mating surface of the firewall cover (See Figure 1, below).
3. Install the firewall cover, then secure it using (6) 9/32" flat washers and (6) 1/4-20 hex nuts with star washers (See Figure 2, below).
4. Install 1/8" thick insulation to firewall, kick panel, inner cowl and firewall cover.
5. To secure the upper firewall cover bolt, the removal of the cowl grille is necessary to access it through the cowl on the outside of the vehicle (See Figure 2 and Photo 2, below).

Install (5) 1/4-20 x 3/4" bolts with (5) 1/4" pushnut bolt retainers

Apply silicone to mating surface of firewall cover

Install a 1/4-20 x 1" bolt with a 1/4" pushnut bolt retainer

Defrost Duct Preparation & Installation

1. Using (2) #6 x 3/8" pan head screws, install the driver-side defrost duct bracket onto the driver-side defrost duct (See Photos 1 and 2, below).
2. Using (2) #6 x 3/8" pan head screws, install the passenger-side defrost duct bracket onto the passenger-side defrost duct (See Photos 3 and 4, below).
3. Install the driver-side defrost duct using a #12 x 1/2" self-tapping screw (See Photo 5, below).
4. Install the passenger-side defrost duct using a #12 x 1/2" self-tapping screw (See Photo 6, below).

Photo 1

Photo 2

Photo 3

Photo 4

Photo 5

Photo 6

www.vintageair.com

Hose Adapter Installation

1. Install (3) S-clips onto the hose adapters as shown in Figure 1, below.
2. Install the driver- and passenger-side hose adapters outside the OEM louvers (See Figure 1, below).

Figure 1

Fresh Air Cap & Kick Panel Cover Preparation

1. Install (4) large grommets and a 7/8" grommet into the fresh air cap (See Photos 1 and 2, below).
2. On the inside of the fresh air cap, the letter "T" indicates the top mounting hole for the firewall (See Photo 3, below).
3. From the center of the bottom-left hole on the kick panel cover, measure 1 1/2" down. Mark and drill a 5/8" hole for the 7/8" grommet (See Photos 4 and 5, below).

Photo 6

Photo 7

Lubricating O-rings

NOTE: Standard torque specifications:
 #6: 11 to 13 ft-lb.
 #8: 15 to 20 ft-lb.
 #10: 21 to 27 ft-lb.

For a proper seal of fittings: Install supplied O-rings as shown and lubricate with refrigerant oil.

Properly Seated O-ring Land

When installing a hardline or A/C hose fitting onto the evaporator module, ensure the O-ring land is seated properly (See Photo 1, below). An improperly seated O-ring land (See Photo 2, below) can cause a leak. To properly install the fitting, slide the hardline or A/C hose nut back to expose the O-ring land and seat it onto the evaporator module fitting. Then, slide the hardline or A/C hose nut forward and thread it onto the evaporator module fitting, ensuring the O-ring land does not move or lift.

Properly Seated O-ring Land

Photo 1

Improperly Seated O-ring Land

Photo 2

NOTE: Photos shown are for reference only. Fittings may vary depending on kit received.

Evaporator Module Preparation

Perform the following on a workbench:

1. Install (2) 1/2" plastic plugs, (1) into the front (See Photo 1, below) and (1) into the back of the evaporator module (See Photo 2, below). **NOTE: These mounting positions will not be used for this application.**
2. Install the upper and lower heater hardlines onto the evaporator module using (2) properly lubricated #10 O-rings (See Lubricating O-rings, Page 12 and Photo 3, below).
3. Install (2) 1/4-20 well nuts into the back of the evaporator module (See Photo 4, below).
4. Install the evaporator firewall bracket onto the module (See Photo 5, below), and secure it using (4) #10 x 5/8" screws (See Photos 5 and 6, below).
5. Install (2) 1/4-20 x 1" serrated flange bolts into the 1/4-20 well nuts (See Photo 7, below).
6. Install a 1/4-20 x 1 1/2" full-threaded stud halfway into the lower mounting hole on the evaporator firewall bracket (See Photo 8, below).
7. Using (2) spring clips, install the floor plenum onto the back of the evaporator module (See Photo 9, below).

Wiring Installation

1. Locate the heater control valve plug on the main wiring harness (white/yellow/purple). Route it through the 7/8" wiring grommet on the kick panel cover (See Photo 1, below) and into the kick panel opening. Then, through the wiring grommet on the fresh air cap (See Photo 2, below) and into the engine compartment.
2. Route the red, white and blue wires from the main harness through the 7/8" wiring grommet on the kick panel cover (See Photo 3, below) and into the kick panel opening. Then, through the wiring grommet on the fresh air cap and into the engine compartment (See Photo 4, below).
3. Leave approximately 12" of wiring between the kick panel cover and relay.
4. Place the evaporator module on the passenger-side floorboard.
5. Route the heavy gauge orange and white wires through the wiring grommet in the kick panel cover (See Photo 5, below) and into the kick panel opening. Then, through the wiring grommet on the fresh air cap and into the engine compartment (See Photo 6, below).

Route main wiring harness (white/yellow/purple) through 7/8" wiring grommet on kick panel cover

Wiring Installation (Cont.)

6. Connect the blower speed controller plug into the main wiring harness plug (orange and green wires) (See Photo 7, below).

Connect blower speed controller plug into main wiring harness plug (orange and green wires)

Photo 7

Kick Panel Cover Installation

1. Route the A/C and heater hoses through the kick panel cover as shown in Figure 1, below.
2. Apply a 1/4" bead of silicone around the mating surface of the kick panel cover as shown in Figure 1, below.
3. Secure the kick panel cover using (5) OEM screws as shown in Figure 1, below.

Figure 1

www.vintageair.com

Evaporator Installation

1. With the evaporator module on the passenger-side floorboard, install the upper and lower heater hoses and hose clamps onto the upper and lower heater hardlines on the evaporator module (See Photos 1 and 2, below).
2. Roll the evaporator module into its mounting position and insert the 1/4-20 x 1 1/2" full-threaded stud into the lower OEM mounting hole on the firewall.
3. Using a properly lubricated #6 O-ring (See Lubricating O-rings, Page 12), install the 45° fitting on the #6 drier/evaporator A/C hose onto the block valve adapter on the evaporator module (See Photo 3, below).
NOTE: Provide enough A/C hose when connecting the 45° fitting to the module. Once the connection is made, pull excess hose into the engine compartment, being sure not to kink it.
4. Using a properly lubricated #10 O-ring (See Lubricating O-rings, Page 12), install the 45° fitting on the #10 compressor/evaporator A/C hose onto the #10 fitting on the block valve adapter on the evaporator module (See Photo 4, below). **NOTE: After installing the #10 compressor/evaporator A/C hose, wrap all exposed metal with the supplied press tape (See Photo 5, below).**

Upper and lower heater hardlines

Wrap all exposed metal with supplied press tape

Photo 5

www.vintageair.com

Evaporator Installation (Cont.)

5. Install a 1/4-20 well nut into the left-front mounting hole on the evaporator module (See Photo 6, below).
6. Install the evaporator dash bracket onto the evaporator module using a 1/4-20 x 1" serrated flange bolt and secure the dash bracket to the dash support brace using a 1/4-20 x 3/4" hex bolt, 9/32" flat washer and a 1/4-20 hex nut with star washer (See Photo 7, below).
7. At the firewall, remove the full-length stud and install a 1/4-20 x 3/4" black serrated flange bolt. Next, install a 1/4-20 x 3/4" black serrated flange bolt into the last open mounting hole on the firewall cover.

Install a 1/4-20 well nut into left-front mounting hole on evaporator module

Photo 6

Photo 7

Fresh Air Cap Installation

NOTE: The fresh air cap installs on the engine side of the firewall.

1. Route the A/C and heater hoses through the fresh air cap as shown in Figure 1, below.
2. Gently pull the slack from the hoses in the passenger compartment, ensuring the hoses are not kinked.
3. Slide the fresh air cap into position, and secure it to the firewall using (2) #14 x 3/4" washer head screws (See Photo 1, below).
4. Apply silicone around the outer edge of the fresh air cap (See Photo 1, below).

Figure 1

Apply Silicone Around Fresh Air Cap

Secure Fresh Air Cap with (2) #14 x 3/4" Washer Head Screws

1968 Center Louver Installation

NOTE: Due to lack of space behind the dash, install the 2 1/2" duct hose onto the adapters before installing the center louvers.

1. Install (4) S-clips onto the hose adapter as shown in Figure 1, below.
2. Install the center louver hose adapter outside the OEM center louver assembly as shown in Figure 1, below.

Figure 1

1969 Center Louver Installation

NOTE: Due to lack of space behind the dash, install the 2 1/2" duct hose onto the adapters before installing the center louvers.

1. Remove the center louver door flap (See Figure 1, below).
2. Install (4) S-clips onto the hose adapter as shown in Figure 1, below.
3. Install the center louver hose adapter outside the OEM center louver assembly as shown in Figure 1, below.

Figure 1

www.vintageair.com

Control Panel Installation

1. Refer to separate instructions included with the control panel kit to install the control panel.

Drain Hose Installation

1. Locate the evaporator drain on the bottom of the evaporator module.
2. In line with the drain, lightly make a mark on the firewall. Measure 1" down. Drill a 5/8" hole through the firewall (See Figure 1, below).
3. Install the drain hose to the outlet on the bottom of the evaporator module, and route it through the firewall (See Figure 2, below).

Figure 1

Figure 2

A/C Hose Installation

Standard Hose Kit:

1. Locate the #8 compressor/condenser A/C hose. Lubricate (2) #8 O-rings (See Lubricating O-rings, Page 12) and connect the 135° female fitting with service port to the #8 discharge port on the compressor (See Photo 1, below). Then, route the straight female fitting to the #8 condenser hardline coming through the core support (See Photo 2, below). Tighten each fitting connection as shown in Lubricating O-rings, Page 12.
2. Locate the #10 evaporator/compressor A/C hose. Lubricate a #10 O-ring (See Lubricating O-rings, Page 12) and connect the #10 135° female fitting with service port to the #10 suction port on the compressor (See Photo 1, below).
3. Lubricate a #6 O-ring (See Lubricating O-rings, Page 12) and connect the straight female fitting from the #6 drier/evaporator A/C hose to the #6 hardline coming through the core support from the drier (See Photo 2, below).

Modified Hose Kit:

1. Refer to separate instructions included with modified hose kit.

Photo 1

Photo 2

www.vintageair.com

Heater Hose & Heater Control Valve Installation

1. Route a piece of heater hose from the water pump to the top heater fitting of heater core as shown in Photo 2, Page 16, and Figure 1, below. Secure it using hose clamps.
2. Route a piece of heater hose from the intake to the bottom heater fitting of the heater core as shown in Photo 2, Page 16, and Figure 1, below. **NOTE: Install the heater control valve in line with intake manifold (pressure side) heater hose. Secure it using hose clamps as shown in Figure 1, below. Also note proper flow direction.**
3. Connect the heater control valve plug to the main harness (See Photo 1, below).

A/C & Heater Hose Routing 1968 Chevelle Shown

NOTE: Vintage Air systems use 5/8" heater connections. On engines equipped with 3/4" hose nipples, these will need to be removed and replaced with 5/8" nipples (not supplied). For water pumps with a cast-in 3/4" heater outlet, a 3/4" x 5/8" reducer fitting (not supplied) or molded hose will need to be installed in the heater hose.

Photo 1

Figure 1

NOTE: Flow direction follows molded arrow on valve.

www.vintageair.com

Heater Hose & Heater Control Valve Installation

1. Route a piece of heater hose from the water pump to the top heater fitting of heater core as shown in Photo 2, Page 16, and Figure 1a, below. Secure it using hose clamps.
2. Route a piece of heater hose from the intake to the bottom heater fitting of the heater core as shown in Photo 2, Page 16, and Figure 1a, below. **NOTE: Install the heater control valve in line with intake manifold (pressure side) heater hose. Secure it using hose clamps as shown in Figure 1a, below. Also note proper flow direction.**
3. Connect the heater control valve plug to the main harness (See Photo 1, below).

A/C & Heater Hose Routing 1969 Chevelle Shown

NOTE: Vintage Air systems use 5/8" heater connections. On engines equipped with 3/4" hose nipples, these will need to be removed and replaced with 5/8" nipples (not supplied). For water pumps with a cast-in 3/4" heater outlet, a 3/4" x 5/8" reducer fitting (not supplied) or molded hose will need to be installed in the heater hose.

Photo 1

NOTE: Flow direction follows molded arrow on valve.

Figure 1a

www.vintageair.com

Wiring Final

1. Select a suitable ground location for the white ground wire eyelet from the heater control valve harness and secure it using a #10 x 1/2" sheet metal screw.
2. Route the violet power wire to a switched 12v power source on the fuse panel (See Photo 1, below).
NOTE: This requires a male fuse extension (not supplied).
3. Connect the tan wire to the factory dash lights to enable control panel backlighting (if applicable).
4. Connect the main harness to the ECU (See Photo 2, below).
5. Select a suitable mounting location for the main relay.

Photo 1

Photo 2

www.vintageair.com

Engine Compartment Wiring

1. Route power and ground wires toward the battery.
2. Install the supplied heat shrink over the 12 AWG orange fuse holder assembly wire, and crimp it to the 12 AWG orange wire from the main wiring harness (See Photo 1, below and Quality Crimp Guidelines, Page 27).
3. Install the supplied heat shrink over the 16 AWG black fuse holder assembly wire, and crimp it to the 16 AWG red wire from the main wiring harness (See Photo 2, below and Quality Crimp Guidelines, Page 27).
4. Install fuses into the holders (See Photo 3, below).
5. Install the supplied heat shrink over the white ground wires, then crimp on the supplied eyelets (See Photos 4 and 5, below and Quality Crimp Guidelines, Page 27)
6. Connect the ground wiring eyelets to the negative battery terminal connector (See Photo 6, below).
7. Connect the positive wiring eyelets to the positive battery terminal connector (See Photo 7, below).

NOTE: Do not connect power until installation is completed.

Install supplied heat shrink over 12 AWG orange fuse holder assembly and crimp to 12 AWG orange wire from main wiring harness

Final Steps: Installation Check

Installation Check	
ITEM TO CHECK	Procedure
☐	ECU If no blinking is observed after 1 minute of turning the ignition on, go to the next check. If repetitive blinking is observed, go to the Advanced Diagnostics Section to diagnose.
☐	Blower speed control Set the blower speed control to OFF , <u>confirm that the blower is off</u> . Position the blower speed control to LOW then MEDIUM and then HIGH . <u>At each setting confirm that the blower speed increases</u> , do this by feeling for the amount of air coming from the unit and hearing the blower speed increase.
☐	Mode control Set the MODE control to the DASH position. <u>Confirm that air is being blown at the dash vents</u> . Set the MODE control to the FLOOR position. <u>Confirm that air is being blown at the floor vents</u> . Set the MODE control to the DEFROST position. <u>Confirm that all air is being blown from the defrost vents</u>
☐	Temperature control If heater lines are installed: Set the MODE control to the DASH position. Set the TEMP control to the MAX HEAT position. <u>Confirm that HOT air is coming from the dash vents</u> . If system is charged: Set the TEMP control to the MAX COOL position. <u>Confirm that COLD air is coming from the dash vents</u> . Also <u>confirm that the compressor "clicks" on</u> when adjusting the TEMP control from the MAX HEAT position to the MAX COOL position.
☐	AC Indicator (If applicable) While the MODE control is set to the DASH position, and the TEMP control is set to the MAX COOL/MIN HEAT position, <u>confirm that the blue AC Indicator light is on</u> .
☐	Backlight (If applicable) If your control panel has backlight capabilities and has been wired, turn the dash lamp on and <u>confirm that the AC panel's legend is lit</u> .
☐	Fittings Verify AC and Heater fittings are all tight.

www.vintageair.com

Final Steps: Completing the Install

1. Install duct hoses as shown in Figure 1, Page 26.
2. Use the supplied tie wraps to position the passenger-side duct hose away from the glove box area.
3. Install the glove box door.
4. Install the new glove box using the OEM screws (See Figure 1, below).
5. Modify the passenger-side kick panel as shown in Figure 2, below.
6. Reinstall all previously removed items.
7. Fill radiator with at least a 50/50 mixture of approved antifreeze and distilled water. It is the owner's responsibility to keep the freeze protection at the proper level for the climate in which the vehicle is operated. Failure to follow antifreeze recommendations will cause heater core to corrode prematurely and possibly burst in A/C mode and/or freezing weather, voiding your warranty.
8. Double check all fittings, brackets and belts for tightness.
9. Vintage Air recommends that all A/C systems be serviced by a licensed automotive A/C technician.
10. Evacuate the system for a minimum of 45 minutes prior to charging, and perform a leak check prior to servicing.
11. Charge the system to the capacities stated on Page 4 of this instruction manual.
12. See Operation of Controls procedures on Page 30.

Figure 1

Figure 2

ECU, Control Panel & Duct Hose Routing

NOTE: For the system to function optimally, the duct hoses must be routed as directly as possible, taking care to avoid kinks, sharp bends and unnecessary length. Vintage Air supplies duct hoses in continuous lengths that will need to be cut to size depending on application. Before cutting, familiarize yourself with the installation instructions and verify the routing will work with your application. For custom hose routing, additional hose may be needed and can be purchased from Vintage Air.

1. Stretch the duct hose until there is no slack, measure, mark and cut hose to size (See Photo 1, below).

Stretch, measure,
mark and cut
hose to size

Photo 1

Figure 1

NOTE: Route wires so they are lower than plugs.

Route wires
lower than plugs

NOTE: ECU must be placed away from water and humidity, and also be accessible for servicing. If relocating, connectors must be positioned towards the bottom.

Position connectors
towards bottom

Quality Crimp Guideline

Acceptable strip length
(Some copper visible)

Crimped area is centered
on each side of splice

Bad strip length
(Too much copper visible)
Visible copper should be
just enough to ensure
clearance between splice
area and wire insulation

Photo 1

A good crimp requires
seam of butt splice to be
opposite of crimp die tooth

Photo 2

Good Ring Terminal Crimp Bad Ring Terminal Crimp

Crimped
area is
opposite
of seam

Photo 3

Crimp
area is
centered
on barrel

Crimp
area is not
centered on
barrel

Excessive
wire "brush"

Crimp area
is on seam
(Should be
opposite)

Photo 4

Photo 5

Photo 5a

Use a ratcheting crimp tool
for insulated barrel terminals
when crimping the provided
female insulated terminal.
Ensure terminal is inserted in
appropriate position before
crimping.

Gen 5 Wiring Diagram

NOTE: = CHASSIS GROUND

* Dash lamp (TAN wire) is used only with type 232007-VUR harness.

** Wide open throttle switch contacts close only at full throttle, which disables A/C compressor.

*** Install fuse assemblies at or as near to the battery as possible.

www.vintageair.com

Gen 5 Wiring Instructions

WIRING HARNESS (231505) ↓

Ignition Switch:

Using provided butt splice (PN 226004), connect the 20 AWG violet wire to a 5A fused and switched 12V source such as Key On.

Wide Open Throttle Switch (Optional):

If a wide open throttle switch is required, connect the 20 AWG pink wire to a normally open switch that, when closed, connects a fused and switched 12V source to the pink wire. See Gen 5 wiring diagram for an example.

Dash Light (Optional):

If using a Vintage Air control panel with back light, connect the 20 AWG tan wire to the vehicle's dash back light 0-12V using provided butt splice (PN 226004).

WIRING HARNESS (232020) →

FIREWALL

FIREWALL

Heater Control Valve:

Connect the Violet/Yellow/White twisted branch with 3 position connector into the heater control valve connector. Ensure that the mating latch is fully seated.

Binary / Trinary & Compressor:

Binary Switch: Terminate provided insulated female terminal (PN 23172-VUW) to the blue 16 AWG wire. Connect as shown.

Trinary Switch: Connect according to trinary switch wiring diagram.

WHITE (12 AWG)

WHITE (20 AWG)

ORANGE (12 AWG)

RED (16 AWG)

NOTE: CONNECT WHITE WIRES DIRECTLY TO (-) BATTERY TERMINAL

Battery Connections:

ECU Ground: Terminate provided ring terminal (PN 226110) to 20 AWG white wire from the 231505 wire assembly and install at battery.

ECU PWR: Terminate provided fuse assembly with black leads (PN 233012) to the 16 AWG red wire from the 231505 wire assembly. Install provided 10A Red Mini Fuse (PN 226118). Install at battery.

Blower Speed Controller (BSC) Ground:

Terminate provided ring terminal (PN 226111) to 12 AWG white wire from the 232020 wire assembly and install at battery.

Blower Speed Controller (BSC) PWR:

Terminate provided fuse assembly with orange leads (PN 233008) to the 12 AWG orange wire from the 232020 wire assembly. Install provided 30A Green ATO/ATC Fuse (PN 226125). Install at battery.

www.vintageair.com

Operation of Controls

On Gen IV or Gen 5 systems with three lever/knob controls, the temperature control toggles between heat and A/C operations. To activate A/C, move the temperature lever/knob all the way to cold and then back it off to the desired vent temperature. For heat operation, move the temperature lever/knob all the way to hot and then adjust to the desired vent temperature. The blower will momentarily change speed, each time you toggle in and out of heat and A/C operations, to indicate the change.

Blower Speed

This lever/knob controls blower speed, from OFF to HI.

Mode Control

This lever/knob controls the mode positions, from DASH to FLOOR to DEFROST, with a blend in between.

Temperature Control

This lever/knob controls the temperature, from HOT to COLD.

A/C Operation

Blower Speed

Adjust to desired speed.

Mode Control

Adjust to desired mode position (DASH position recommended).

Temperature Control

For A/C operation, adjust to coldest position to engage compressor (Adjust between HOT and COLD to reach desired temperature).

Heat Operation

Blower Speed

Adjust to desired speed.

Mode Control

Adjust to desired mode position (FLOOR position recommended).

Temperature Control

For maximum heating, adjust to hottest position (Adjust between HOT and COLD to reach desired temperature).

Defrost / De-fog Operation

Blower Speed

Adjust to desired speed.

Temperature Control

Adjust to desired temperature.

Mode Control

Adjust to DEFROST position for maximum defrost, or between FLOOR and DEFROST positions for a bi-level blend (Compressor is automatically engaged).

Troubleshooting Guide

This printed troubleshooting guide is our basic guide that covers common installation problems. To see our advanced diagnostics and troubleshooting guide, please refer to the following page for instructions on how to download the complete guide.

WARNING: While troubleshooting the system, never probe connector terminals from the front mating side, only back probe.

WARNING: While troubleshooting the system, never use automotive check lights.

Symptom	Condition	Checks	Actions	Notes
1. Blower stays on high speed with ignition on.	No other functions work. All other functions work.	Check for damaged pins or wires in the control panel wire assembly and mating header at ECU. Check for a bad ECU GND. Check for damaged pins or wires in the control panel wire assembly and mating header at ECU. Check if Blower power fuse is blown. Check for a bad ECU GND.	If found damaged, replace wire assembly or ECU. If found damaged, replace wire assembly or ECU. Replace fuse. Repair connection.	If fuse continues to blow, there is a serious problem in the wiring. Check all wiring and ensure the wire is not damaged and shorting out along its route.
2. Compressor will not turn on (All other functions work).	System is not charged. System is charged.	System must be charged for compressor to engage. Check for faulty A/C potentiometer or associated wiring (not applicable to 3-pot controls). Check for disconnected or faulty thermistor.	Charge system. Check continuity to ground on white control head wire. Check for 5V on red control head wire. Check 2-pin connector at ECU housing.	Danger: Never bypass safety switch with engine running. Serious injury can result. To check for proper pot function, check voltage at white/red wire. Voltage should be between 0V and 5V, and will vary with pot lever position. Disconnected or faulty thermistor will cause compressor to be disabled.
3. Compressor will not turn off (All other functions work).		Check for faulty A/C potentiometer or associated wiring. Check for faulty A/C relay.	Repair or replace pot/control wiring. Replace relay.	Red wire at A/C pot should have approximately 5V with ignition on. White wire will have continuity to chassis ground. White/Red wire should vary between 0V and 5V when lever is moved up or down.

www.vintageair.com

Troubleshooting Guide (Cont.)

Symptom	Condition	Checks	Actions	Notes
4. System will not turn on, or runs intermittently.	Works when engine is not running; shuts off when engine is started	Noise interference from either ignition or alternator.	Install capacitors on ignition coil and alternator. Ensure good ground at all points. Relocate coil and associated wiring away from ECU and ECU wiring. Check for burned or loose plug wires.	Ignition noise (radiated or conducted) will cause the system to shut down due to high voltage spikes. If this is suspected, check with a quality oscilloscope. Spikes greater than 16V will shut down the ECU. Install a radio capacitor at the positive post of the ignition coil (see radio capacitor installation bulletin). A faulty alternator or worn out battery can also result in this condition.
	Will not turn on under any conditions.	Verify connections on power lead, ignition lead, and both white ground wires.	Check for power at ECU, and confirm ignition is being applied to ECU properly.	
		Verify battery voltage is greater than 10 volts and less than 16 while engine is running.	Verify proper meter function by checking the condition of a known good battery.	
5. Loss of mode door function.	No mode change at all.	Check for damaged mode switch or potentiometer and associated wiring.		
6. Blower turns on and off rapidly.	Battery voltage is at least 12V.	Check for at least 12V at circuit breaker.	Ensure all system grounds and power connections are clean and tight.	System shuts off blower at 10V. Poor connections or weak battery can cause shutdown at up to 11V.
	Battery voltage is less than 12V.	Check for faulty battery or alternator.	Charge battery.	
7. Erratic functions of blower, mode, temp., etc.		Check for damaged switch or pot and associated wiring.	Repair or replace.	

Advanced Diagnostics and Troubleshooting Guide

If after referencing the Troubleshooting Guide, the issue is not resolved, move to The Advanced Diagnostics and Troubleshooting Guide that covers the following:

- **ECU Diagnostics Codes**
 1. *ECU Blink Sequence*
 2. *Firmware Version Number*
 3. *ECU Model Number*
 4. *ECU Start-Up Blink Sequence*
 5. *Diagnostic Codes*
- **Complete Advanced Troubleshooting Guidelines**

Access the latest version of the Advanced Diagnostics and Troubleshooting Guide by scanning the following QR code on your mobile device:
